## 1 Résumé du Scientifique

Research in post-quantum cryptography (PQC) has been boosted since [the National Institute of Standards and Technology \(NIST\) initiated its PQC standardization project in 2016](#). The development of PQC schemes minimally progresses through four stages:

1. **Mathematical Foundations:** Assessing the computational hardness of underlying mathematical problems;
2. **Scheme Construction:** Designing cryptographic schemes by leveraging these mathematical problems to create secure trapdoors;
3. **Algorithm and Prototype Development:** Developing algorithms and coding prototypes, leading to the release of specifications for standard algorithms;
4. **Deployment and Adoption:** Implementing and widely disseminating the cryptographic schemes.

While many schemes, such as Kyber and Dilithium, have reached stages three or four, PQC research remains an active field. There are still numerous open problems and challenges, particularly following [NIST's announcement of new candidates for post-quantum signatures in 2023](#). Additionally, enhancing efficiency and strengthening implementations against side-channel attacks (SCA) are ongoing priorities. It is also essential to adapt PQC to current applications, including communication protocols, hardware security modules (HSM), and various scenarios such as the Internet of Things (IoT) and vehicular communication.

In this research project, I will delineate the challenges that PQC confronts in terms of its security evaluation regarding its physical aspects. While presenting these challenges, I will put forth a proposal outlining strategies to address the evaluation of security and measurement of the countermeasures against side-channel attacks.

## Security Analysis of Post-Quantum Schemes

Cryptosystems face vulnerabilities to SCA, wherein an adversary can deduce confidential information from physical observations, such as timing, electromagnetic emanation, or power consumption, made during the execution of sensitive computations. These attacks can be classified as passive, where the adversary simply observes leaked information without interfering, or active, where faults are intentionally injected to manipulate computations and extract secrets. Both types pose serious threats and have been successfully employed across various applications, often proving challenging to detect.

Exploring SCA requires specialized equipment and training, as the methodologies and countermeasures are highly dependent on the targeted cryptosystem. While techniques exist to mitigate these attacks, many are intrinsic to specific schemes and lack easy adaptability to others. Consequently, securing each implementation demands a unique approach, necessitating expertise in both cryptographic engineering and side-channel analysis. Unfortunately, the pool of individuals capable of combining these essential skills remains limited to a select group of professionals.

Producing new knowledge in this domain aligns with the objectives of the new cybersecurity master's program at *École Polytechnique de Paris*, which aims to equip students with advanced

expertise in cryptographic security, hardware security, and side-channel analysis. By fostering research and innovation in these critical areas, the program contributes to the development of next-generation security professionals capable of addressing emerging threats in cryptography and beyond.

This proposal establishes a comprehensive security evaluation framework for post-quantum digital signature schemes under consideration in the NIST ongoing standardization process. The study focuses specifically on side-channel attack resilience, addressing critical gaps in practical security assessment through three synergistic objectives.

1. Systematic Vulnerability Analysis

- Investigation targets: NIST PQC candidates
- Attack methodologies:
  - *Passive*: Time analysis, and Differential power analysis (DPA)
  - *Active*: Clock and voltage glitching

2. Adaptive Countermeasure Design

- Algorithm-aware protection strategies:
  - Dynamic masking for lattice-based schemes
  - Error-canceling blinding for FFT-dependent operations

3. Quantitative Security Benchmarking

Metric	Evaluation Methodology
Side-channel resistance	Test Vector Leakage Assessment (TVLA) with $t > 4.5$ threshold
Computational overhead	Cycle count analysis vs. NIST baseline specifications
Energy efficiency	Per-signature measurements (mJ/operation)
Standardization readiness	FIPS 140-3 compliance mapping

Methodological Approach

The proposed framework employs a three-phase iterative process:

1. *Attack surface enumeration*: Formal verification of cryptographic primitives using ProVerif
2. *Countermeasure prototyping*: RTL implementation in SystemVerilog
3. *Validation*: ASIC/FPGA testing on Xilinx UltraScale+ platforms

To achieve the goals we will require the acquisition of certain materials presented in Table 1. Moreover, I plan to to hire a PhD student to study hardware security.

The methodology that we will follow can be seen in Figure ??

Impacts, Outcomes, and Ambitions

The results of this research will contribute to the broader scientific community by:

**Publications.** Targeting top-tier cryptography and security conferences and journals such as CHES, EUROCRYPT, ASIACRYPT, IEEE Transactions on Information Forensics and Security, and the Journal of Cryptographic Engineering.

Table 1: Budget for hardware equipment.

Hardware	Usage	Qty	Total Price (€)	Link
Husk Board	Side-channel acquisition / fault attack	2	1060	<a href="#">Mouser</a>
Server	Run analysis and store the data acquired by the boards.	1		
Polarfire FPGA	Development of specific hardware for cryptography	1	150	<a href="#">Microchip</a>
Arty S7: Spartan-7 FPGA	Development of specific hardware for cryptography	1	300	<a href="#">Digilent</a>
CW-lite ARM	Small ARM board for side-channel attacks	2	700	<a href="#">NewAE</a>
Nucleo ARM	Board with Cortex-M3/M4	4	400	
PicoScope 3000E	Oscilloscope	1	4,225	<a href="#">PicoTech</a>
Wires / Cables / Others	Connection with oscilloscope, soldering kit, etc.	1	700	

**Conferences & Collaborations.** Engaging in academic collaborations with international early-career researchers, including [Monika Trimoska](#) and [Fábio Campos](#), as well as continuing partnerships with other international researchers like [Chris Brzuska](#) and Łukasz Chmielewski. Additionally, initiating a project with local researcher Guénaél Renault. Participation in research workshops and summer schools, such as the [Summer School on Real-World Cryptography and Privacy](#), is also planned.

**Industrial Impact.** Establishing connections with industry stakeholders, particularly in embedded security and hardware-based cryptographic implementations, to assess the practical adoption of countermeasures. My background with [Qualcomm](#) facilitates establishing connections for future collaborations. Moreover, I have connections with professionals like Matthieu Rivain and Sonia Belaïd from [CryptoExperts](#), and with Christine Cloostermans at [NXP](#), opening avenues for further industrial partnerships.

**Funding Prospects.** This work is positioned to support funding applications through agencies such as the European Research Council (ERC), the French National Research Agency (ANR), and cybersecurity-focused industrial partnerships.

## Budget

## 2 Calendrier

### 3 CV

1. The scientific summary (maximum 3 pages) highlighting the following sections, in connection with the evaluation criteria:
  - **Presentation:** positioning, challenges, objectives, methods, links with the School's strategy.
  - **Impacts, outcomes, and ambitions:** publications, conferences, collaborations, industrial contracts, funding acquisition (ERC, ANR, ...).
2. The timeline detailing the work plan over 3 years (maximum 1 page).
3. The projected budget over 3 years (maximum 1 page). This budget must be realistic, and the Foundation reserves the right to suspend or even terminate the project's funding, particularly in the event of an unjustified failure to comply with the budget.
4. The candidate's CV (maximum 3 pages).

### CV

Start	End	Institution	Position and status
01/10/2024	Current	INRIA	ISFP (Cryptography Researcher)
01/06/2022	30/09/2024	Qualcomm	Senior Cryptographer
01/12/2020	30/05/2022	INRIA Saclay	Post Doc
01/11/2019	30/11/2020	Chalmers University of Technology	Post Doc
01/11/2015	12/11/2019	Technische Universiteit Eindhoven	Ph.D. Candidate
01/09/2018	01/12/2018	CryptoExperts	Internship
01/02/2017	01/05/2017	Riscure	Internship
01/10/2014	31/10/2015	Bry Tecnologia	Software Engineer
